```
% ROB521 assignment2.m
% =====
% This assignment will introduce you to the idea of estimating the
% of a mobile robot using wheel odometry, and then also using that
% odometry to make a simple map. It uses a dataset previously
gathered in
% a mobile robot simulation environment called Gazebo. Watch the
video,
% 'gazebo.mp4' to visualize what the robot did, what its environment
% looks like, and what its sensor stream looks like.
% There are three questions to complete (5 marks each):
્ટ
    Question 1: code (noise-free) wheel odometry algorithm
2
    Question 2: add noise to data and re-run wheel odometry algorithm
    Question 3: build a map from ground truth and noisy wheel
odometry
% Fill in the required sections of this script with your code, run it
% generate the requested plots, then paste the plots into a short
report
% that includes a few comments about what you've observed. Append
% version of this script to the report. Hand in the report as a PDF
file.
% requires: basic Matlab, 'ROB521_assignment2_gazebo_data.mat'

```
ree) wheel odometry Question 1: code (noise-stree) wheel odometry algorithm
```

Write an algorithm to estimate the pose of the robot throughout motion using the wheel odometry data (t\_odom, v\_odom, omega\_odom) and assuming a differential-drive robot model. Save your estimate in the variables (x\_odom y\_odom theta\_odom) so that the comparison plots can be generated below. See the plot 'ass1\_q1\_soln.png' for what your results should look like.

```
% variables to store wheel odometry pose estimates
numodom = size(t_odom,1);
x_odom = zeros(numodom,1);
y odom = zeros(numodom,1);
theta_odom = zeros(numodom,1);
% set the initial wheel odometry pose to ground truth
x_{odom(1)} = x_{true(1)};
y_{odom(1)} = y_{true(1)};
theta_odom(1) = theta_true(1);
% -----insert your wheel odometry algorithm here-----
for i=2:numodom
    theta_new = omega_odom(i)*(t_odom(i) - t_odom(i-1)) +
 theta odom(i-1);
    if theta new > pi
        theta_new = theta_new - 2*pi;
    elseif theta_new < -pi</pre>
        theta_new = theta_new + 2*pi;
    end
    x_new
              = v_odom(i)*cos(theta_new)*(t_odom(i) - t_odom(i-1)) +
 x_{odom(i-1)};
              = v_odom(i)*sin(theta_new)*(t_odom(i) - t_odom(i-1)) +
    y_new
 y \text{ odom}(i-1);
    x_{odom(i)} = x_{new};
    y_odom(i) = y_new;
    theta_odom(i) = theta_new;
end
% -----end of your wheel odometry algorithm------
% plot the results for verification

% Question 2: add noise to data and re-run wheel odometry algorithm
% Now we're going to deliberately add some noise to the linear and
% angular velocities to simulate what real wheel odometry is like.
  Copy
% your wheel odometry algorithm from above into the indicated place
  below
% to see what this does. The below loops 100 times with different
  random
```

```
% noise. See the plot 'ass1_q2_soln.pdf' for what your results should
 look
% like.
% save the original odometry variables for later use
v_odom_noisefree = v_odom;
omega_odom_noisefree = omega_odom;
% set up plot
figure(2);
clf;
hold on;
% loop over random trials
for n=1:100
    % add noise to wheel odometry measurements (yes, on purpose to see
 effect)
    v odom = v odom noisefree + 0.2*randn(numodom,1);
    omega_odom = omega_odom_noisefree + 0.04*randn(numodom,1);
    % -----insert your wheel odometry algorithm here-----
    for i=2:numodom
        theta new = omega odom(i)*(t odom(i) - t odom(i-1)) +
 theta_odom(i-1);
    if theta_new > pi
        theta_new = theta_new - 2*pi;
    elseif theta_new < -pi</pre>

              = v_odom(i)*cos(theta_new)*(t_odom(i) - t_odom(i-1)) +
    x new
 x_{odom(i-1)};
              = v \cdot odom(i) * sin(theta new) * (t \cdot odom(i) - t \cdot odom(i-1)) +
    y new
 y_{odom(i-1)};
    x_{odom(i)} = x_{new};
    y_odom(i) = y_new;
    theta_odom(i) = theta_new;
    end
    % -----end of your wheel odometry algorithm-----
    % add the results to the plot
    plot(x_odom, y_odom, 'r');
end
% plot ground truth on top and label
plot(x_true,y_true,'b');
xlabel('x [m]');
ylabel('y [m]');
title('path');
```

Now we're going to try to plot all the points from our laser scans in the robot's initial reference frame. This will involve first figuring out how to plot the points in the current frame, then transforming them back to the initial frame and plotting them. Do this for both the ground truth pose (blue) and also the last noisy odometry that you calculated in Question 2 (red). At first even the map based on the ground truth may not look too good. This is because the laser timestamps and odometry timestamps do not line up perfectly and you'll need to interpolate. Even after this, two additional patches will make your map based on ground truth look as crisp as the one in 'ass1\_q3\_soln.png'. The first patch is to only plot the laser scans if the angular velocity is less than 0.1 rad/s; this is because the timestamp interpolation errors have more of an effect when the robot is turning quickly. The second patch is to account for the fact that the origin of the laser scans is about 10 cm behind the origin of the robot. Once your ground truth map looks crisp, compare it to the one based on the odometry poses, which should be far less crisp, even with the two patches applied.

```
% set up plot
figure(3);
clf;
hold on;
% precalculate some quantities
npoints = size(y laser,2);
angles = linspace(phi_min_laser, phi_max_laser,npoints);
cos angles = cos(angles);
sin_angles = sin(angles);
for n=1:2
    if n==2
        % interpolate the noisy odometry at the laser timestamps
        t_interp = linspace(t_odom(1),t_odom(numodom),numodom);
        x interp = interp1(t interp,x odom,t laser);
        y_interp = interp1(t_interp,y_odom,t_laser);
        theta interp = interp1(t interp, theta odom, t laser);
        omega_interp = interp1(t_interp,omega_odom,t_laser);
    else
        % interpolate the noise-free odometry at the laser timestamps
        t_interp = linspace(t_true(1),t_true(numodom),numodom);
        x_interp = interp1(t_interp,x_true,t_laser);
        y_interp = interp1(t_interp,y_true,t_laser);
        theta_interp = interp1(t_interp,theta_true,t_laser);
        omega_interp = interp1(t_interp,omega_odom,t_laser);
    end
    x map = [];
    y_map = [];
    laser_angles = linspace(phi_min_laser, phi_max_laser,
 size(y_laser, 2))';
    % loop over laser scans
    for i=1:size(t_laser,1)
```

```
% ----insert your point transformation algorithm here----
        for j=1:size(y_laser, 2)
            if omega_interp(i)<0.1</pre>
